Corrosion protection maintenance with Isotrol

The Swedish National Road Administration, Western Region, has performed maintenance painting/repainting of the following objects (all movable bridges):

P 12 Dalslands kanal Billingsfors (Drawbridge) year 1992

Overcoating of the old lead-based paint on the balance arms.

P 702 Jordfallsbron (Double leaf bridge) year 1993

Overcoating of the old lead-based paint on all mechanical and electrical equipment in both chambers of the bascule.

Movable bridges along Dalslands Canal start year 1998

Continuous touch up painting on exposed positions in order to postpone a complete repainting.

Since Isotrol only calls for a restricted pre-treatment and can be overpainted on fixed lead-based paint we selected this paint system. Thereby we avoided blasting, which would have involved expensive temporary tight covering to protect delicate machinery and the environment against dust.

Furthermore we are of the opinion that it is important to extend the lifetime of the existing paint systems by partial touch up painting.

On the objects mentioned above we have prolonged the lifetime of the existing paint systems with a good result.

With best regards

Jonas Andersson
