**ISOTROL ANTI-CORROSIVE PAINT**

Referring to your inquiry concerning ISOTROL we can state the following:

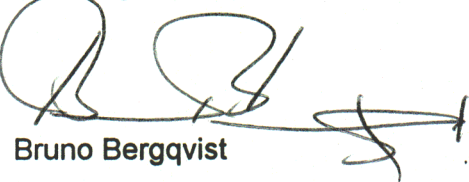

As earlier declared in the FMV report "FMV:QMaterial, VOT 70/91, 1991-04-26, Painting system for rusty surfaces", ISOTROL has been tested. The official test results which relate are attached here to. Such tests were conducted in the open and exposed to the ingresses of natural and foreign corrosive elements for 14 years.

The reason for this test is that FMV has found ISOTROL to have good capacity of penetrating especially into overlapped surfaces corroded by rust that are impossible to be cleaned what is necessary in the pre-treatment before anti-corrosive painting.

On the basis of the result of this test, the Defence Forces use today ISOTROL in the painting in excess of one thousand "UNIFLOTE" pontoons stored in the open for emergency use, as well as other bridges, masts etc. The experiences have been good so far and confirm the results reported.

The red lead earlier used can be replaced by ISOTROL.
