Re: Isotrol

The pivot bridge at Brokind lock over Kinda channel is situated in direct connection with the historic building Brokind's country house and is part of the areas of national interest Brokind and Kinda Canal. The bridge has in a culture-historical inventory been judged to be of great value.

In year 2006 the county administrative board granted means for restoration of the bridge.

The bridge, which had not been maintained since 1932, was in a very poor condition and so rusty that some steel parts had to be exchanged. The construction is made out of riveted steel girders.

The pre-treatment was carried out with sweep blasting; priming performed with 1 time Isotrol Grund, intermediate coating with 2 times Isoguard Pansar, and final coating with 2 times Isotrol Finish.

The work was carried out during August-September 2002 and the result is after five years still good.

When, by different reasons, it is impossible to achieve the degree of cleanliness required for use of two-component paint systems, Isotrol is ideal.

Our experience of Isotrol is that very good results are obtained on rusty surfaces. Isotrol is also excellent for touch-up painting.

Best regards
